
full coverage: Risk(τ_0) = classifier failure rate
random κ (no ranking): risk stays constant
Example κ
Perfect κ^*
Random κ
AURC*: unavoidable, set by the classifier
E-AURC: excess due to the ranking of κ
operating point at threshold τ
accepts 70% of predictions, 6.8% of them failures
E-AURC
AURC*
Risk (failure rate among accepted)
Coverage (fraction of predictions accepted)
